

Project Design Phase

Auto Ticket Classification using Flow Designer

Auto Ticket Classification using Flow Designer:

The solution architecture for Auto Ticket Classification using Flow Designer connects ticket intake, automated classification, assignment routing, and agent review. Its goals are to:

Automate routine ticket categorization and routing to reduce manual triage effort.

Describe the components, workflow, data flow, and platform responsibilities to project stakeholders.

Define ticket intake, classification rules, assignment, exception handling, and notification requirements.

Provide specifications for configuring, testing, managing, and delivering the workflow.

Solution Architecture Diagram:

Figure 1: Logical architecture and ticket data flow for Auto Ticket Classification using Flow Designer

Platform reference: <https://www.servicenow.com/products/flow-designer.html>

Architecture and Data Flow:

Requester / Employee ↓ Service Portal / Ticket Form ↓ Ticket Record (Incident / Case) ↓ Flow Designer Trigger (created or updated) ↓ Classification Logic (configured conditions / rules) ↓ Set Category, Subcategory and Priority ↓ Assignment Group Routing ↓ Agent Work Queue → Review / Correction when needed ↓ Status Update and Notifications

Architecture Components:

Date	28 September 2026
Team ID	
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Component	Purpose
User interface	Service Portal / Employee Center and ticket forms

Component	Purpose
Workflow orchestration	Flow Designer trigger, actions, conditions, and routing logic
Ticket data	Incident / Case records, category fields, assignment group, status, and audit history
Exception handling	Unclear or unmatched tickets are routed to a designated agent review queue
Integrations	Optional approved email, identity, or REST integrations when configured
Deployment	ServiceNow cloud instance; connected local systems only through approved interfaces
