

Project Design Phase

Auto Ticket Classification using Flow Designer

Date	28 September 2026
Team ID	SWTID-2026-4543
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Auto Ticket Classification using Flow Designer:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Support tickets may be manually categorized and assigned, causing delays, inconsistent categorization, and additional effort for support teams. Tickets can also reach the wrong support group when their details are unclear.
2	Idea / Solution description	Use ServiceNow Flow Designer to trigger a workflow when a ticket is created or updated. Evaluate ticket fields and description using configured conditions or classification rules, populate category and subcategory, and route the ticket to the appropriate support group. Send unclear or unmatched tickets to a review queue for agent validation.
3	Novelty / Uniqueness	The solution connects ticket intake, rule-based classification, assignment routing, and exception handling in a configurable low-code workflow. Classification and routing rules can be adjusted as ticket types and support groups change.
4	Social Impact / Customer Satisfaction	Faster and more consistent routing can reduce waiting time, help users receive responses from the relevant team, and provide agents with clearer ticket information. Human review remains available for uncertain classifications.
5	Business Model (Revenue Model)	Internal service-management efficiency solution. Value can be measured through reduced manual triage effort, shorter assignment delays, and improved support-team productivity. Any platform licensing or implementation cost depends on the organization's ServiceNow agreement and deployment.
6	Scalability of the Solution	Additional categories, assignment groups, and routing conditions can be added through configuration. The workflow can be extended to more ticket types and integrated services, subject to platform capacity, governance, and performance testing.
