

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	28 September 2026
Team ID	SWTID-2026-4543
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. For the project “Auto Ticket Classification using Flow Designer”, the team can identify the problems involved in manually reviewing and classifying tickets and generate ideas for automating the process. During brainstorming, the team can discuss different ways to use Flow Designer to classify incoming tickets, organize the possible classification approaches, and identify the ideas that can be taken forward for the project. Different ideas can be built upon and refined through team collaboration before selecting the most suitable approach.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The team discusses the existing ticket-handling process and identifies the difficulties involved in manually checking and classifying tickets.

Problem Statement: Incoming support tickets need to be classified correctly so that they can be handled through the appropriate workflow. Manual classification can require additional time and can result in inconsistent classification.

The team proposes using Flow Designer to automate the ticket-classification process by using the information available in each ticket and applying the defined classification logic.

Step-2: Brainstorm, Idea Listing and Grouping

The team brainstorms ideas related to automatic ticket classification using Flow Designer.

Idea	Description
Ticket Information	Identify the ticket information required for classification, such as the ticket description and relevant fields.
Classification	Define suitable ticket categories and the conditions used to identify each category.

Flow Designer	Create a Flow Designer flow that processes the ticket information and performs the required classification action.
Automatic Routing	Use the classification result to continue the appropriate workflow or route the ticket for further processing.
Unclassified Tickets	Provide a separate handling path for tickets that do not match the defined classification conditions.
Testing	Test the flow with different ticket examples to check whether the classification works as expected.

Step-3: Idea Prioritization

The brainstormed ideas are prioritized according to their relevance to the project, ease of implementation in Flow Designer, and their role in completing the automatic ticket-classification process.

Priority	Idea	Reason for Prioritization
1	Define ticket classification conditions	Provides the basic logic required to identify and classify different tickets.
2	Build the Flow Designer flow	Connects the ticket information and classification logic into an automated process.
3	Handle the classification result	Allows the flow to continue with the appropriate workflow after classification.
4	Handle unclassified tickets	Provides a safe path for tickets that do not match the defined conditions.
5	Test different ticket examples	Helps verify that the classification flow behaves correctly for different inputs.

Expected Outcome:

A Flow Designer-based process that automatically classifies incoming tickets according to the defined conditions and continues the appropriate workflow, while allowing unmatched tickets to be handled separately.
